RWorksheet BIBIT#1

2024-09-04

- 1. Set up a vector named age, consisting of 34, 28, 22, 36, 27, 18, 52, 39, 42, 29, 35, 31, 27, 22, 37, 34, 19, 20, 57, 49, 50, 37, 46, 25, 17, 37, 42, 53, 41, 51, 35, 24, 33, 41.
- a. How many data points?

There are 34 Data Points

b. Write the R code and its output.

```
age <- c(34, 28, 22, 36, 27, 18, 52, 39, 42, 29, 35, 31, 27, 22, 37, 34, 19, 20, 57, 49, 50, 37, 46, 25, 17, 37, 42, 53, 41, 51, 35, 24, 33, 41)

length(age)
```

[1] 34

2. Find the reciprocal of the values for age. Write the R code and its output.

```
age <- c(34, 28, 22, 36, 27, 18, 52, 39, 42, 29, 35, 31, 27, 22, 37, 34, 19, 20, 57, 49, 50, 37, 46, 25, 17, 37, 42, 53, 41, 51, 35, 24, 33, 41)

reciprocal_age <- 1 / age
reciprocal_age
```

```
## [1] 0.02941176 0.03571429 0.04545455 0.02777778 0.03703704 0.05555556
## [7] 0.01923077 0.02564103 0.02380952 0.03448276 0.02857143 0.03225806
## [13] 0.03703704 0.04545455 0.02702703 0.02941176 0.05263158 0.05000000
## [19] 0.01754386 0.02040816 0.02000000 0.02702703 0.02173913 0.04000000
## [25] 0.05882353 0.02702703 0.02380952 0.01886792 0.02439024 0.01960784
## [31] 0.02857143 0.04166667 0.03030303 0.02439024
```

3. Assign also new_age <- c(age, 0, age).

```
age <- c(34, 28, 22, 36, 27, 18, 52, 39, 42, 29, 35, 31, 27, 22, 37, 34, 19, 20, 57, 49, 50, 37, 46, 25, 17, 37, 42, 53, 41, 51, 35, 24, 33, 41)

new_age <- c(age, 0, age)
```

What happen to the new_age?

```
The c() function is utilized to combine the vectors, resulting in the new_age vector, which comprises 69 elements: the initial 34 elements from the age vector, followed by a single 0, and finally, the duplicate 34 elements from the age vector.
```

4. Sort the values for age.

Write the R code and its output.

```
sort(age)
## [1] 17 18 19 20 22 22 24 25 27 27 28 29 31 33 34 34 35 35 36 37 37 37 39 41 41
## [26] 42 42 46 49 50 51 52 53 57
  5. Find the minimum and maximum value for age.
min_age <- min(age)</pre>
max_age <- max(age)</pre>
print(paste("Minimum age:", min_age))
## [1] "Minimum age: 17"
print(paste("Maximum age:", max_age))
## [1] "Maximum age: 57"
  6. Set up a vector named data, consisting of 2.4, 2.8, 2.1, 2.5, 2.4, 2.2, 2.5, 2.3, 2.5, 2.3, 2.4, and 2.7.
  a. How many data points?
     12
  b. Write the R code and its output.
data <- c(2.4, 2.8, 2.1, 2.5, 2.4, 2.2, 2.5, 2.3, 2.5, 2.3, 2.4, 2.7)
length(data)
## [1] 12
  7. Generates a new vector for data where you double every value of the data.
data_doubled <- data * 2
print(data_doubled)
## [1] 4.8 5.6 4.2 5.0 4.8 4.4 5.0 4.6 5.0 4.6 4.8 5.4
What happen to the data?
We created a new vector data_doubled by
doubling every value in the original data vector,
resulting in a new vector with the same number of elements
but with each element twice
the value of the corresponding element in the original vector.
```

```
8.1 Integers from 1 to 100
data_1_to_100 <- 1:100
data_1_to_100

```

a. How many data points from 8.1 to 8.4?_____

So, the total number of data points from 8.1 to 8.4 is: 100 + 41 + 1 + 1 = 143

Therefore, the answer is: 143

b. Write the R code and its output from 8.1 to 8.4. $\,$ 8.1 $\,$

```
data_1_to_100 <- 1:100
data_1_to_100
```

[1] ## [19] ## [37] ## [55] ## [73] [91] 99 100 ##

print(multiples)
## [1] 3 5 6 9 10 12 15 18 20 21 24
  12. Statements can be grouped together using braces '{' and '}'.
  A group of statements is sometimes called a block.
  Single statements are evaluated when a new line is
  typed at the end of the syntactically complete statement.
  Blocks are not evaluated until a new line is
  entered after the closing brace.
  Enter this statement:
 x < -\{0 + x + 5 + \}
Describe the output.
When you enter x \leftarrow \{0 + x + 5 + \},
you'll get an error because the statement is incomplete
and R expects more input.
The trailing + symbol indicates R is waiting for another operand,
and the { brace isn't properly closed, causing the error.
```

a. How many data points from 10 to 11?

```
13. *Set up a vector named score,
consisting of 72, 86, 92, 63, 88, 89, 91, 92, 75, 75 and 77.
To access individual elements of an atomic vector,
one generally uses the x[i] construction.
Find x[2] and x[3].
Write the R code and its output.
score <- c(72, 86, 92, 63, 88, 89, 91, 92, 75, 75, 77)
score[2]
## [1] 86
score[3]
## [1] 92
14. *Create a vector a = c(1,2,NA,4,NA,6,7).
a \leftarrow c(1, 2, NA, 4, NA, 6, 7)
  a. Change the NA to 999 using the codes print(a,na.print="-999").
a \leftarrow c(1, 2, NA, 4, NA, 6, 7)
print(a, na.print="-999")
## [1]
               2 -999
                          4 -999
                                    6
                                          7
  b. Write the R code and its output. Describe the output.
a \leftarrow c(1, 2, NA, 4, NA, 6, 7)
print(a, na.print="-999")
## [1]
                          4 -999
                                    6
                                          7
          1
               2 -999
The output shows the vector a with the NA values replaced with -999 when printed.
The actual values in the vector a remain unchanged,
only the way they are printed is affected by the na.print argument.
15. A special type of function calls can appear on the left hand side of the assignment
operator as in > class(x) <- "foo".
 name = readline(prompt="John Benedict Bibit")
## John Benedict Bibit
age = readline(prompt="19")
## 19
print(paste("My name is", name, "and I am", age , "years old."))
## [1] "My name is and I am years old."
print(R.version.string)
## [1] "R version 4.4.1 (2024-06-14)"
```
